Re: Treatment for covered bridge
Proposal

Date: July 24, 2014

Proposal to treat covered bridge on Roscoe Road

1. Treatment for carpenter ants:

Each hole will be treated individually with a micro injector.
The micro injector turns liquid chemical into a gas and is applied directly to each hole. The gas will flow through the tunnel that has been made. This type of treatment prevents the chemical from dripping into the stream.

2. Treatment for powder post beetles:

This treatment is done by hand using a small paintbrush. The application also prevents the chemical from dripping into the stream.

The cost for these two treatments will be \$1200 not to exceed \$2000. This cost varies because it is unknown as to how much powder post beetle damage has been done.

Please contact me with any additional questions.
